

Peripheral Artery Disease Screening

Peripheral arterial disease, also known as P.A.D., is a serious condition that doubles your risk of having a heart attack or stroke. P.A.D occurs when plaque builds up in the lining of your arteries – a process known as atherosclerosis. Atherosclerosis causes your arteries to narrow and limits the flow of oxygen-rich blood to your legs. If this process is occurring in your legs, it is likely happening in the arteries that supply your heart and brain and can result in a heart attack or stroke.

Learn more about P.A.D and understand your risks.
Join us for a Free P.A.D. Screening and information event:

**Tuesday, July 27, 2010
9:00am - 3:00pm**
